Notes

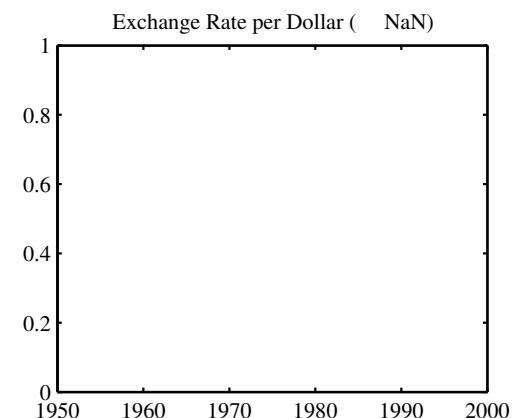

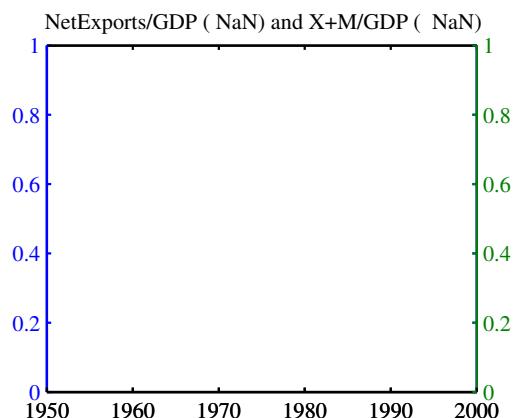

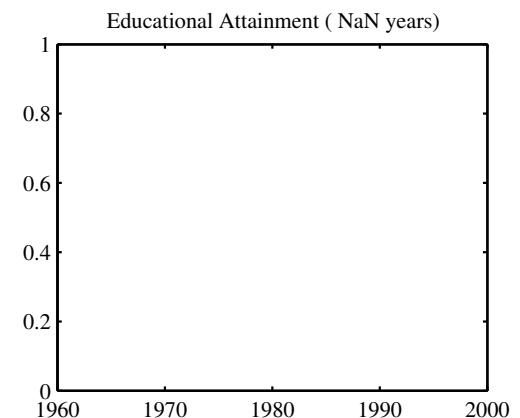

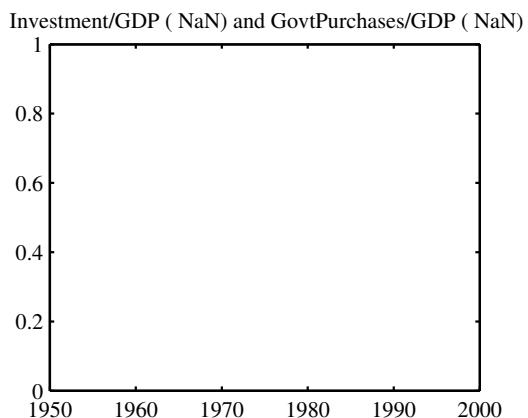

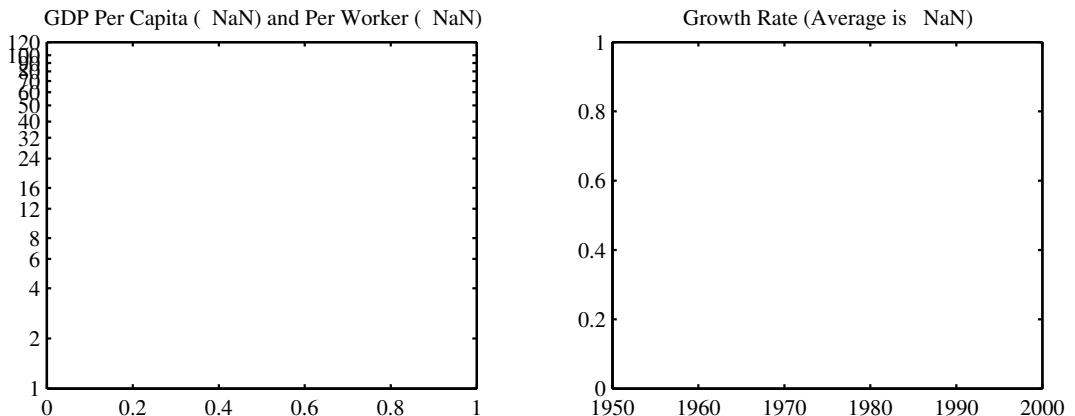

- From a country page, click on the country name to return to the main index page.
- From a country page, click on ([data](#)) in order to open a xls spreadsheet file of the data for that particular country. This file is in an older Excel format that any spreadsheet program should be able to read (in fact, you can set up your web browser's preferences to open the .xls file with your spreadsheet program automatically). The notes below also apply to the data file. “NaN” in the file denotes a missing observation.
- The first graph of GDP per capita and GDP per worker is drawn on a “ratio scale” (also called a “log scale”). For all countries other than the United States, values are relative to the United States (US=100). For the United States, these variables are reported in chained 1996 international dollars.
- The titles to the graphs include a value for each variable in parentheses. This is the most recent value available for each series (often corresponding to the year 2000).
- Population is reported for the most recent year available in millions next to the country name.
- The growth rate in the second graph is for per capita GDP; in the spreadsheet file, it is calculated as the percentage change.
- In graphs with 2 data series, the title lists the name of the two series. The first title corresponds to the solid blue line. The second title corresponds to the green dashed line.
- The ratios of investment to GDP (I/Y) and government purchases to GDP (G/Y) are based on the constant-price series in the Penn World Tables. The trade balance (NX/Y) and total trade share (X+M/Y) are based on the current price series.
- All of the Penn World Tables variables (which is all other than educational attainment) are in international prices. This means the variables will differ from the corresponding variables from country national accounts data.
- Additional copies of this file and a history of changes may be obtained from
